About Me

Hi, my name is Névio, a full-stack developer studying software development for about five years with two years of experience. I've already worked on building web sites, web apps, mobile apps, APIs and scripts to automate boring work processes. I love to work with software development and currently at 19 I've made my choice to keep working for the rest of my life with it. I love playing video games and practicing outside exercises. I hope we can work together!

Projects

Hand Detector
Python project that I made to apply the knowledge that I received from online courses. The hand detector has three modes: count fingers, volume controller and object moving. All three use the base code to detect the hand.

User Interface Prototype
This is a React Native project that I made as a way to start studying UX / UI in mobile apps. I used styled-components for the project styling.
